

PRESS RELEASE

AKIPS develops the most scalable and featured network monitoring software, delivered at a commodity price.

Brisbane, Australia – January 2015 – AKIPS helps target your IT infrastructure spend

Another year of technology releases and wireless gadgets abound for 2015 with the release of the iWatch, patents issued for the iPen, and ever growing presence of Android devices, the call on the network, particularly wireless access points, is growing and is expected to continue to grow exponentially over future years. Such user demands place a strain on the ability of the core network to perform, with the options open to the Network Manager limited by budgets that need to be allocated wisely to ensure optimum network performance. That strain is only going to become more pronounced as users bring along not only their laptops, but other devices including their phones, tablets and a myriad of other devices they received last holiday season.

Sometimes we hear stories of CIO's and Network Managers who try to spend their way out of performance issues with little result as they have not used appropriate tools to identify where constraints lie on their networks, thereby enabling results to extract the best bang for their dollar. Although just a small feature of AKIPS Network Monitor solution, user tailored performance charts quickly provide the evidence metrics that enable network managers to identify and address the true strains on their network. For example, identifying when a network access device is overloaded (e.g. the allocation of internet bandwidth coverage to a wireless access point is being called upon by too many users devices), or simply when a piece of equipment responds with elevated temperature alerts (potentially indicating a failing fan or a broader air conditioning temperature issue).

The list of possible day to day alerts and metrics available, with dynamic interactive graphing showing up to three years of history, provides the transparency over the network that then allows tailoring of IT spend. This information gives network managers the guidance to best allocate their limited budgets.

AKIPS provides 100% visibility across your network, runs on a Virtual Machine (eliminating any requirement to purchase expensive computer hardware), has built in alerting to warn of possible network outages, and best of all, the annual subscription includes support, group training, upgrades, and new features. AKIPS is an integrated package that has no software licensing limitations on any technology (e.g. devices, interfaces, MIB objects, Netflow, Syslog, Traps, etc). AKIPS has a solution for any size network and is available online without the additional cost of endless up-sell options.
